Dear Example Corp Hiring Team,

I am excited to apply for the Senior Software Engineer, Platform role at Example Corp. Your mission of giving engineering teams a dependable, self-service platform resonates with how I like to work, because I believe the best infrastructure fades into the background and lets product teams move quickly without worrying about the plumbing underneath. Over the past several years I have built exactly the kind of paved-road tooling, internal APIs, and automation that your platform team is investing in, and I would love to help your engineers and third-party developers ship faster with fewer operational surprises. The chance to shape a platform that other people depend on every day is the work I find most rewarding.

In my current role I led the migration of a monolithic payments service into independently deployable microservices, which cut our deploy time from hours to minutes and made on-call far more predictable. Because reliability matters so much on a platform, I paired that work with structured logging, distributed tracing, and service-level objectives across more than thirty services, cutting mean time to resolution by roughly a third. I am equally comfortable designing an event-driven pipeline that processes tens of millions of events a day and sitting with a product team to smooth out a rough onboarding flow. What ties these projects together is a habit of building well-tested, observable systems in Go and Python that colleagues can extend and trust long after I have moved on.

I would welcome the opportunity to talk about how my background in distributed systems, API design, and platform engineering could help Example Corp. Thank you for considering my application, and I look forward to hearing from you.

Sincerely,
Jordan Rivers
