

Jordan Rivers

City, ST • jordan.rivers@example.com • linkedin.com/in/jordanrivers

Summary

- Senior platform engineer with eight years building **Go services, REST APIs, and distributed systems** for synthetic products
- Operate fictional workloads on **AWS, Kubernetes, and Terraform** with measured reliability, observability, and recovery
- Partner with application and product teams to deliver **safe rollouts and reusable platform interfaces**

Education & Skills

Education: B.S. in Computer Science, Lakemont University, 2018

Programming Languages: Go, Python, Java, SQL, Bash

Skills: AWS, Kubernetes, Terraform, PostgreSQL, Docker, Redis, REST APIs, distributed systems, microservices, CI/CD, Git, observability, service-level objectives

Experience

Northwind Systems – Senior Software Engineer 2022 – Present | Remote (US)

- Owned **reliability targets for 22 fictional services** and presented monthly risk trends to three synthetic product groups
- Reviewed distributed backend designs with six invented engineers and defined **safe rollback criteria** for high-risk changes
- Led quarterly failure drills that improved staged incident recovery from **47 minutes to 29 minutes** while preserving the synthetic release cadence

Regional deployment control plane

- Built a **Go regional delivery control plane** orchestrating 180 synthetic releases each week across three invented regions
- Integrated **Terraform previews and policy checks** that reduced example deployment configuration errors by 32% before every staged regional rollout

Service telemetry platform

- Standardized **metrics, logs, and traces across 22 fictional services**, cutting tabletop incident triage by 38% for product and operations teams
- Introduced **service-level objectives and impact dashboards** that connected alerts to synthetic customer outcomes

Blue Lantern Labs – Software Engineer 2018 – 2022 | Fairview, ST

- Built and operated **REST APIs backed by PostgreSQL** for an invented scheduling product serving 310 fictional businesses
- Supported eight synthetic services on call and documented **repeatable incident diagnostics** for common staged failures
- Mentored two fictional interns on automated testing, code review, and **incremental backend delivery** through two complete staged projects

Scheduling data migration

- Migrated **74 million synthetic records into PostgreSQL** without interrupting staged scheduling API traffic across two rehearsed cutover windows
- Added checksums and restartable checkpoints that shortened invented migration rehearsals by **51%**

Developer delivery pipeline

- Containerized local and **CI/CD workflows**, reducing example build-and-test time by 58%
- Added **REST API contract tests** that caught 27 synthetic compatibility regressions before staged releases
